Glossary

- Several AI terms have been used in this pack and are defined below
- If the AI system is a car, the AI model is the engine, and the AI Assistant is what you touch in the driver's seat

Term	Definition
AI system	An AI system is an AI product or tool that connects users to AI models. They have various features including chat history, persona or 'agent' creation and sharing, knowledge retrieval, document upload, etc. Microsoft and Github Copilot, aiQ Chat, KymChat and KPMG Clara AI are examples of AI systems.
AI model	An AI model is the underlying large language model (LLM) of an AI system, responsible for processing the user's prompts/agent instructions and providing outputs. The term is used to differentiate how AI models behave compared to AI assistants.
AI assistant	AI assistants are the middle-men or the interface between you and an AI model within an AI system.
Prompt	A prompt is the comms from a user to an AI model via an AI assistant.
AI agent	An AI agent is the combination of an LLM, tools and knowledge with the core purpose of performing a specific action.
Agent instructions	Agent instructions define the purpose, task and boundaries of an agent, as well as how to use the tools it has available to execute its task.
AI	The conceptual term to describe computer systems capable of performing cognitive tasks that typically require human intelligence.

Key Principles for Prompt Engineering

- Avoid inaccuracies with clear and complete instructions
- Request verifiable evidence
- Be the human in control
- Acknowledge limitations of AI models
- Respect data privacy and confidentiality
- Be mindful of bias
- Iterate and learn

Understand the Limits of AI Models & AI Systems

- AI models and systems are extremely powerful - they can help you execute tasks faster than ever before
- As people, we perform multidimensional analysis when executing a task, but this is not typically wholly communicated to an AI assistant
- In a world where work is **prepared** increasingly by AI, it is necessary to be aware of the natural limits to understand why manual verification of results remains essential

Limit	GPT-5 Model via Copilot	GPT-4o via aIQ Chat and KymChat
Prompt size limit	272,000 tokens	128,000 tokens
Response size limit	128,000 tokens	4,000 tokens
'The middle issue'	AI models pay less attention to the middle of excessively long/complex prompts	
Knowledge Retrieval (RAG)	Microsoft Graph RAG and Semantic Index, Azure AI Search, Azure Content Understanding	aIQ Chat – KPMG-built RAG (coming soon) KymChat – KPMG-built RAG
Training dataset limitations	• Sep 2024 knowledge cutoff • <u>AI models cannot provide accurate sources and associated information directly from their training dataset</u>	• Oct 2023 knowledge cutoff • <u>AI models cannot provide accurate sources and associated information directly from their training dataset</u>
Hallucinations	Often occurs when there is incomplete information, incomplete instructions or gaps in files provided for the AI assistant to complete a task	

Prompt Engineering Guidance

- For simple tasks, avoid overengineering a prompt/agent instructions – if you achieve desired results with simple instructions, then well done!
- For complex tasks, employing a framework and specialist techniques will improve the quality and consistency of results
- Complex tasks include multidimensional analysis, a lot of **do's and don'ts**, interpretation against KPMG IP and guidance, etc

Formula Aspects	Simple Tasks	Complex Tasks
Complexity	Low, straightforward input-output	High, requiring multi-step reasoning or workflows
Dependence on Structure	Minimal or none; task often executed based on brief prompts/agent instructions	High dependency on structured instructions, roles, or guides
Context Understanding	Surface-level or generic context suffices	Requires nuanced domain-specific or scenario-specific comprehension
Role of AI	Low complexity automation and productivity	Advanced augmentation, problem-solving, or domain expertise
Task Examples	Drafting, summarising, rephrasing, reformatting	Financial modelling, coding, scoring, nuanced IP elicitation

Recommended Techniques for simple tasks

Techniques	Description
Zero-Shot Prompting	Ask a question or instruct the AI assistant to execute a task without specific examples
Role/Persona-Based Prompting	Assign the AI assistant a role or persona to guide its behaviour, making it act as if it were that character
Chain-of-Thought (CoT)	Explain to the AI assistant how you want it to answer the question or provide a solution
Few-Shot CoT	Include a completed example and explain to the AI assistant how you want it to answer the question or provide a solution

Recommended Techniques for simple tasks

Role/Persona-Based prompting + Zero-Shot Prompting	Chain-of-Thought (CoT)	Few-Shot CoT
1. Assign the AI assistant a role (or 'persona') to guide its behaviour. This will guide it to act as if it has the implicit or explicit expertise + 2. Write a question or instruction without including an example of expected input + output	1. Explain to the AI assistant how you want it to answer the question or provide a solution	1. Provide one or more Q&A examples so the AI assistant understands the format and context of your inputs and expected output 2. For the example answer, explain how you want the AI assistant to complete it before providing the answer (it will mimic you) 3. Then ask it a question or instruct the task and leave the answer section blank for the AI assistant to complete
I am a tax advisor at KPMG specialising in ultra-high net worth individuals. Please write a client pitch tailored to families who own logistics companies in Japan that import products into Melbourne's ports. Please write the client pitch in Japanese.	Which business type has the strongest negative outlook based on the latest Mid-Market Pre-Budget survey. Please analyse the statistics in the report and forecast five business opportunities. First, analyse the survey's statistics and trends to determine the challenges and opportunities faced by different business types. Then, forecast five potential business opportunities by logically connecting the survey findings to emerging market needs and trends. Provide a step-by-step explanation of your analysis and reasoning.	Q: Based on business transformation case studies on the KPMG website, which related industries should KPMG target? A: Identify related case studies and analyse the subjects and their related industries. Evaluate the options based on KPMG's ability to make a significant positive impact. Conclude by recommending which related industries are ideal to target and provide your reasoning. Accordingly, the ideal related industries to target are: 1. Healthcare and Life Sciences: Organizations in this sector can leverage KPMG's expertise in business transformation and technology solutions to improve patient care, streamline operations, and adapt to regulatory changes 2. Financial Services: Banks, insurance companies, and other financial institutions can benefit from KPMG's deal advisory and business transformation services to navigate mergers and acquisitions, regulatory changes, and digital transformation initiatives. Q: Which manufacturing sectors should KPMG target based on the report 'Australian manufacturing: Discover growth amid turbulence'? A: [AI Assistant to provide response]

Recommended Framework & Techniques for complex tasks

- A simple formula is recommended unless scenarios arise where you need to execute complex tasks
- Complex task examples include multidimensional analysis, interpretation of events against regulatory standards, tasks with a lot of **do's and don'ts**, etc
- *The **R-T.I.D.E. Framework** was created by CTG's Prompt Engineering Practice Lead for KPMG products and services

Framework		Description
R-T.I.D.E. Framework*	Role	Define the role of the AI assistant or yourself
	Task	Clearly state the overarching task of the prompt/agent instructions
	Instructions	Provide detailed instructions or a sequence of steps for the AI assistant/AI agent to execute
	Dynamic Content	Add sections for dynamic content depending on the context of the task
	Example Output	Provide an example of the desired response, which may also include dynamic content inputs

Techniques	Description
Chain-of-thought Decomposition (CoT)	• Explain to the AI assistant a scenario and the associated issues with appropriate detail • Ask it a question or give an instruction related to the issues • Then ask it to decompose the question/instruction into sub-questions and sub-answers and display them to you before providing the final answer, which will illustrate its thinking
Prompt Chaining	Decompose a large task into a sequence of prompts/agents that each have one core focus

R-T.I.D.E. Framework Examples

Role

You are portfolio manager at an ASX listed financial services firm.

Task

Your task is to evaluate the sentiment of the provided Reports. The 1st Report was written for FY25 Q4, and the 2nd Report was written for FY26 Q1, both about the firm's performance.

Instructions

- Provide sentiment analysis for each report – use at most one paragraph per Report.
- What are the growth and detractor areas quarter-on-quarter?
- Compare the plan in the 1st Report to the completed tasks in the 2nd Report. Did they do what they said they would do in the 1st Report? Provide your response as an itemised list with Yes/No/Partial per item. If a reason was provided for why they deviated or may need to deviate from the plan, paraphrase it, and separately, quote the deviation reason text from the respective Report - please ****do not**** paraphrase or change the quoted text in any way.

Reports [Dynamic Content]

****1st Report:**** [attach report]

****2nd Report:**** [attach report]

Example Response

[Paste the ideal layout and quality of desired responses]

R - Role
T - Task
I - Instructions
D - Dynamic Content*
E - Example**

*Dynamic Content may include several sections with distinct headings.

**It may be appropriate to rename the Example heading to best suit the intent of the task.

Role

You are a software developer.

Task

Your task is to convert the following CoCo Info in a two-column table into the below JSON Format.

Instructions

Please convert the first 10. You must include all text for each Business Description in the JSON output (****do not**** omit or paraphrase any information).

CoCo Info [Dynamic Content]

Company Name Business Description
[Paste CoCo table text]

JSON Format [Example Output]

Example JSON Format:

```
[
{
  "content":
  {
    "coco_id": "(start from 1)",
    "coco_name": "",
    "coco_business_description": ""
  }
}
]
```

R-T.I.D.E. Framework Examples (Adapted)

Role

I am an asset manager at an ASX listed financial services firm. APRA has released a New Standard called ****[APRA CPS 230 File]****.

Instructions

Please analyse the requirements for Business Continuity Plans in the New Standard, then evaluate whether those requirements are satisfied in [BCP file]. Please refer to the ****Guidance**** below and provide your response in a table with the following columns: APRA Paragraph ID, Update Required per APRA, Affected BCP Section.

Guidance

- For 'Update Required per APRA', please quote the text directly from the New Standard and clarify its meaning if required.
- For 'Affected BCP Section', please advise the respective heading, whether the current information is acceptable or whether an update is required (and explain what is required).
- If a new section is required in the BCP file, print it in 'Affected BCP Section' with the prefix 'New Section: [Title]' and explain what is required.
- Please err on the side of caution in your identification of BCP requirements in the New Standard – we will be penalised if we miss any!

Take a deep breath and think about this problem step-by-step. This is very important to my career.

R - Role
T - Task
I - Instructions
D - Dynamic Content
E - Example

Some tasks will not require all framework sections, and you may elect to adapt them to the task.

You may need to include a guidance section, excerpts from regulations, templates to embed in responses, etc.

Task

You are an expert HR Generalist at KPMG. I am going to give you a List of Skills that our staff demonstrate at differing levels of competency. We want to establish a consistent Rating Scale for these skills and we need your help to produce a concise definition per rating per skill. ****Use at most one sentence per rating per skill.****

Rating Scale

1 = Emerging capability
3 = Competent Capability
5 = Highly Proficient Capability

Example

Skill: Project Management

1 = Emerging Capability:

Demonstrates a basic understanding of project management principles but requires significant guidance and supervision to manage projects.

3 = Competent Capability:

Effectively manages projects independently, meeting objectives reliably and coordinating team efforts competently.

5 = Highly Proficient Capability:

Excels in managing complex projects, consistently delivering exceptional results and demonstrating mastery in strategic planning and execution.

List of Skills [Dynamic Content]

[Paste list of skills here]

R-T.I.D.E. Framework Examples (Adapted)

Task

Please read my Client's Tax Issue and Scope of Analysis summary and then write the Scope of Services content for the client's tax advice deliverable using the Template.

Instructions

YOU MUST:

1. Clearly state the tax topic, the tax issue, and a summary of the scope.
2. Use at most one statement for the summary of scope - keep it laser focused on the client's question (****do not**** mention the legislation required to solve it).
3. Include the tax topics covered in the Scope of Analysis as a bullet point list of in scope items and ensure that you sensibly group associated rules and guidance together.
4. Use the template below and insert information into it based on your understanding of the client's tax issue and analysis required to resolve the issue.
5. You must always be succinct and concise! I'm going to tip \$300k for a better solution!

Client's Tax Issue [Dynamic Content]

[Tax Issue]

Scope of Analysis [Dynamic Content]

[Scope of Analysis]

Template

We refer to your request for advice in relation to {{tax topic}} for [insert Company name]. The scope of our advice is limited to {{summary of scope}} and includes consideration of the following:

<line break>

-
-

<line break>

It does not include {{out of scope}}. All legislative references in this advice are to the {{legislation references}}, unless otherwise stated. Our advice is provided in accordance with our engagement letter dated [insert date].

Example Output

We refer to your request for advice in relation to the classification of a financial instrument for [insert Company name]. The scope of our advice is limited to determining whether the financial instrument is characterised as debt or equity for tax purposes and includes consideration of the following:

- The criteria for classification under Division 974 of the Income Tax Assessment Act 1997 (ITAA 1997)
- The implications of material changes on the financial instrument
- The Taxation of Financial Arrangements (TOFA) regime
- Thin capitalisation considerations
- Transfer pricing implications
- Withholding tax consequences
- The application of Australian Taxation Office (ATO) interpretative decisions

All legislative references in this advice are to the ITAA 1997, unless otherwise stated. Our advice is provided in accordance with our engagement letter dated [insert date].

...

Take a deep breath and work on this problem step-by-step. This is very important to my career.

R - Role
T - Task
I - Instructions
D - Dynamic Content
E - Example

Some tasks will not require all framework sections, and you may elect to adapt them to the task.

You may need to include a guidance section, excerpts from regulations, templates to embed in responses, etc.

Recommended Techniques for complex tasks

CoT Decomposition

1. Explain to the AI assistant a scenario and the associated issues with appropriate detail
2. Then ask it a question or give an instruction related to the issues
3. Lastly, ask it to decompose the question/instruction into sub-questions and sub-answers before providing the final answer (which will illustrate its thinking)

Large clients in Australia are systematically trying to reduce their spend on consulting firms due to questions about value for money services, post pandemic pressures on balance sheets and ongoing mixed signals about Australia's economy. Let's say that this could lead to a reduction of KPMG's annual revenue of approximately \$800 million.

This is an issue because it would require a significantly higher volume of deals for KPMG to earn that lost revenue from smaller companies as their deal size is typically smaller. I want you to substantively examine the situation to identify eight target markets (and their subsectors) that can recover the potential \$800 million in lost revenue for KPMG.

I want you to decompose your target market analysis into a series of succinct and concise sub-questions and sub-answers and display them to me. Once you have answered all the sub-questions, please provide the final answer.

Prompt Chaining

Decompose a large task into a chain of prompts/AI agents that each have one core focus

Prompt 1

KPMG Australia has been contracted to deliver services to a Govt Department and will engage subcontractors as part of the delivery.

As a commercial lawyer, your task is to review the 'head agreement' on behalf of KPMG Australia to identify all clauses with obligations that impact subcontractors involved in the delivery of the engagement.

Steps

1. Identify how 'subcontractor' is defined or referenced in the head agreement, including any indirect references. Please note that any clause where obligations on the 'service provider' or similar terms would, by definition, also impact subcontractors.
- ...
3. Present your findings in a table titled 'Subcontractor Special Conditions' with the following columns:
 - Clause ID: Clause ID and title
 - Clause Text (verbatim): Quote the clause exactly as written in the head agreement. ****DO NOT**** summarise or paraphrase text. YOU MUST always retain all key criteria and all sub-rules (****do not**** use ellipses).

...

Prompt 2

Role

You are an expert at analysing Subcontractor Agreements for KPMG engagements.

Task

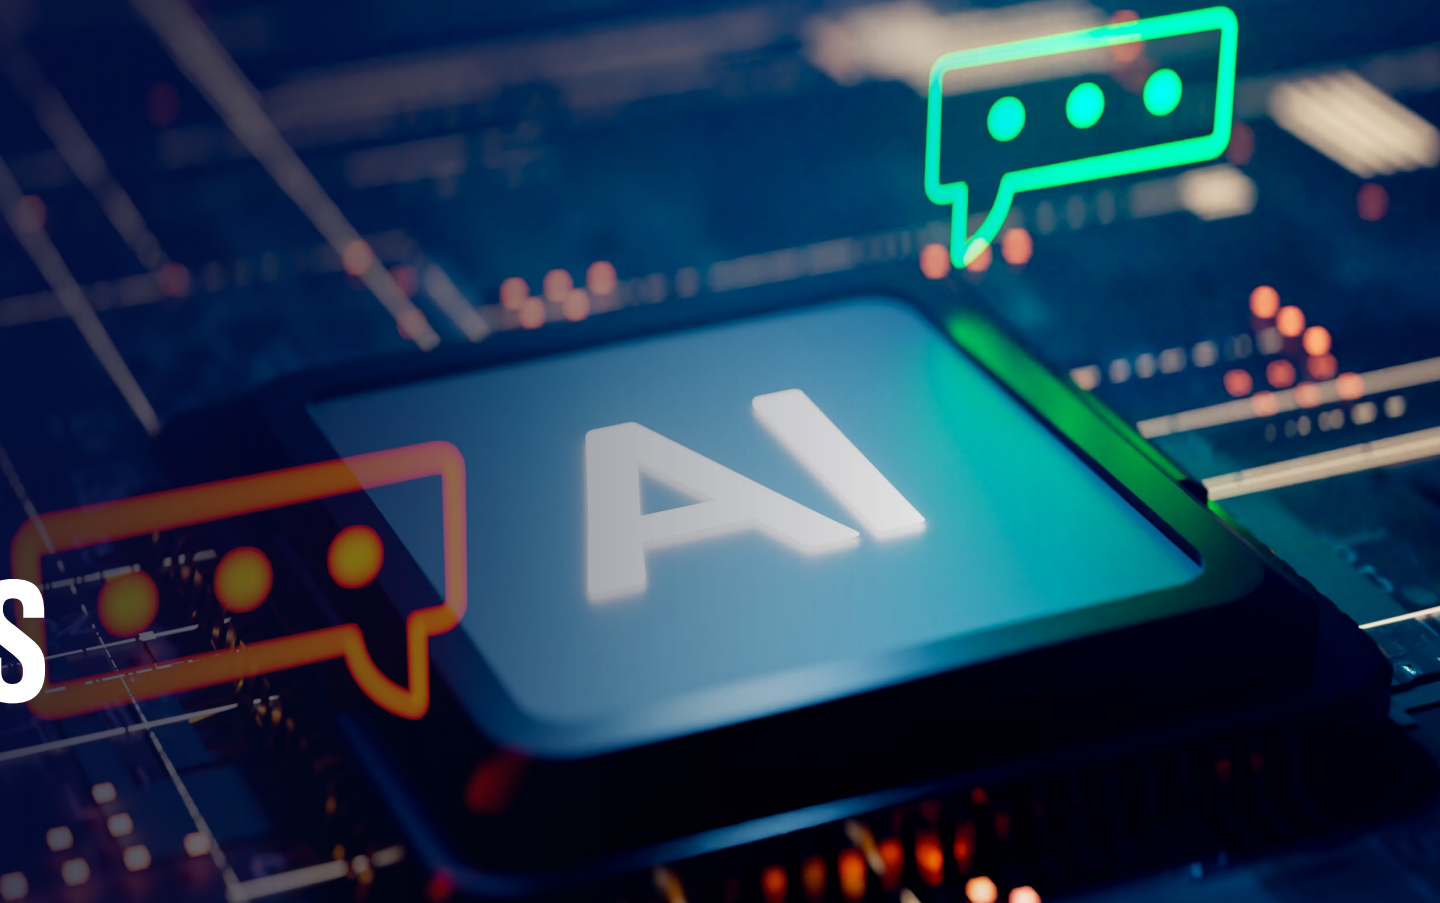

Your task is to align the clauses identified in the ****Subcontractor Special Conditions table**** above with the clauses in the ****[File]**** and then use the ****Clause Text**** to update the Terms and Conditions for subcontractor obligations where required.

Steps

1. For each clause listed in the ****Subcontractor Special Conditions table****:
 - Determine which Clause Section must be amended in the ****[File]****.

...

Strengths & Weaknesses

Strengths of AI

- Copilot = Copilot Chat using GPT-5
- Copilot Studio-built AI agents also use M365 footprint data and offers Bing web search
- Colour coding indicates typical complexity of PE formula for the work task, but ultimately it is scenario-dependent

Work Task	Co-pilot	aIQ	Kym	Work Task	Co-pilot	aIQ	Kym
Draft/rewrite documentation based on a specified lens and guidelines				Supplement prompts/agent instructions with M365 files in Outlook, OneDrive, Teams messages and KPMG intranet content		X	X
Identify synergistic sales opportunities based on KPMG documentation, products and relationships				Supplement provided knowledge in prompts/agent instructions with Bing internet search results		X	X
Elicit information and provide recommendations based on files included in a prompt			X	Generate content in M365 file formats (e.g., Word doc, email, excel file, pptx)		X	X
Elicit information and provide recommendations based on documentation ingested into a persona	Use 'Note-books'	X		Build and execute financial models and generate software/programming code			
Data transformation: Plain text to tables, tables into JSON arrays, merge JSON arrays				Perform sophisticated, comprehensive document analysis based on files included in a prompt			X
Market research and sentiment analysis based on defined sets of rules				Codify KPMG IP and use it to draft content for engagements			

Weaknesses of AI

Weakness	Comments
Simple repetitive programming tasks	For example, data transformation tasks like reformatting text and merging JSON arrays. AI models have a habit of dropping text in these contexts so you must be explicit and tell them “Do not omit or paraphrase any information” and validate this over a random sample to manually ensure the results include all expected content. If you want to transform a lot of information into a particular structure, ask for 10 conversions at a time, else you may get 3 and a statement encouraging you to replicate the pattern.
Knowledge retrieval capability (RAG pattern)	The ability to retrieve the relevant knowledge related to a prompt/agent instructions depends on the AI system you are using, whether it be from files uploaded, files ingested into a persona or files linked as knowledge for an AI agent.
The middle issue	Earlier AI models were proven to follow instructions well at the beginning and end of a prompt and miss the middle of them. While this has improved dramatically with newer AI models, there is only so much ‘thinking capacity’ an AI model has per LLM call. In technical terms, the ‘lost in the middle’ issue in LLMs arises from the transformer architecture’s attention mechanism, which tends to prioritise tokens at the beginning and end of long sequences, leading to reduced focus and retention of information in the middle. It is always recommended to decompose large, complex prompts into a prompt chain to achieve high quality results, which also reduces the likelihood of conflicting information.
Hallucinations	Hallucinations typically occur when there is incomplete information, incomplete instructions or gaps in files provided for the AI assistant to complete a task that it has been instructed to execute. Additionally, retrieved knowledge could be incorrectly combined by an AI model to respond to a prompt, presenting as a hallucination.

Avoid Inaccuracies and hedge against hallucinations

Best Practice Advice
Always give the AI assistant the space to respond negatively.
Use conditional language when you are not sure if the information required to complete the task will be provided/included. For example, “Your response should include...” as opposed to “...must include...”.
Explain to the AI assistant that it might not have/be able to identify the information required.
For example, “The subsection may not include information for this scenario – if so, respond with: Not included.”
You might include the sentence, “You must only use the information I provide to you” if you are worried about the AI model’s general knowledge being used in the response.
You might include the sentence, “If this information does not exist, flag it with ‘Insufficient information to {{insert statement}}’.”
You can also ask the AI to “list the information that is missing.” For complex tasks, decompose instructions into numbered lists and specify what to do if data is missing or unclear.

You are an AI assistant supporting the Ethics & Independence team at KPMG Australia. Please provide information about the Risk Announcement regarding the two-prong test for tax services. You must only use the information I provide to you.

- Instructions:
1. Provide the list of relevant subsection IDs from the Q&RMM. If you can't identify any, ignore the below and only respond with: Not identified. ←
 2. Consider the content in the subsections.
 3. Write a memo to KPMG Ethics & Independence employees about what is permissible and quote relevant information from the subsections. Use at most 3 paragraphs, and use bullet points as required.
 4. Write a respectful, blunt email to the CEO of the audit client advising what services are permissible while it holds the status of a KPMG Audit client. Use at most 400 words.

Not identified.

🗑️ 🗨️ 👍 AI created content

If you reached conclusions from your experiments in the selected income period, describe those conclusions. ⓘ (XXXX / XXXX characters)

Conclusions Statement:

The evaluation of experiments confirmed that the hypothesis was valid. The custom software solution significantly improved the automated processing of death claims by maintaining workflow integrity during high-volume periods, ensuring data integrity and system performance post-migration, achieving high accuracy in document validation and compliance with business rules, generating accurate and complete letters, and demonstrating successful integration and scalability.

Next Steps:
Insufficient information to explain what the client will do with the conclusive information.

Sources: [KPMG ██████████.docx - Satisfy], [KPMG ██████████.docx - Phase 2]

Validate Results

Best Practice Advice

- Always request verifiable evidence in the response if you are using AI to perform analysis and make determinations.
- For example, ask to present results in a table with direct quotes, input file page numbers, rationales for determinations, etc.
- You must then validate the accuracy and reliability of the response against the source data provided to make the determination – especially for tasks that include long or complex documents.
- You might include the sentence, “For each [Yes/No/Unsure] determination, quote the evidence for your determination word-for-word and display the information in a table with the columns: [Clause], Determination, Quote.”
- By decomposing a large task into a sequential process, you will save time by picking up errors earlier in the process, as opposed to working backwards from the end to identify the breakpoint.

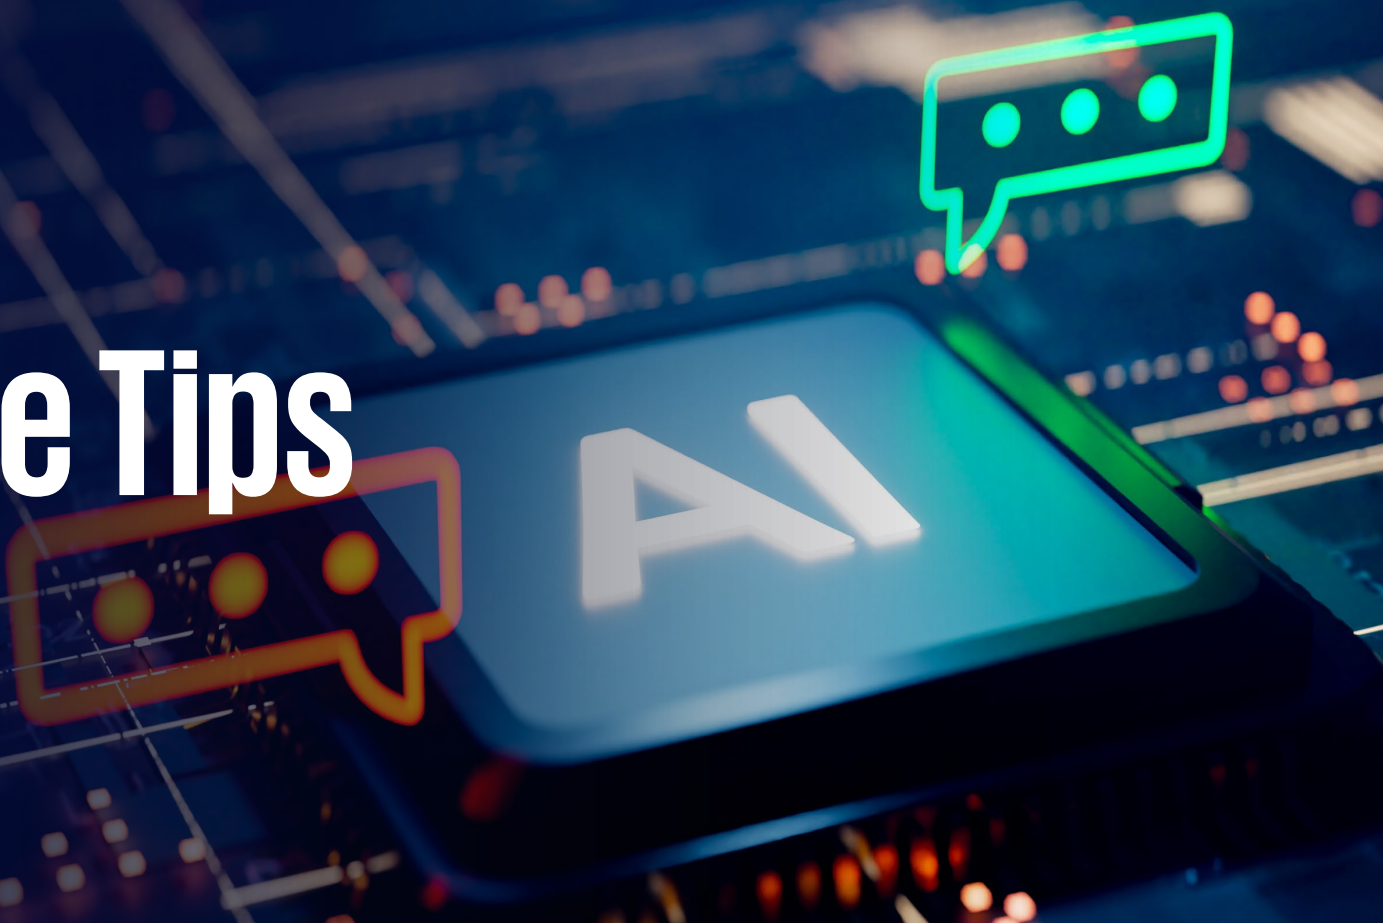

CPS 230 BCP Requirements vs. Current BCP

APRA Paragraph ID	Update Required per APRA	Affected BCP Section
112 (Key principles)	"An APRA-regulated entity must: ... maintain its critical operations within tolerance levels through severe disruptions; ..." (clarifies that tolerance levels are central to continuity) APRA Prudential Stan...	New Section: Critical Operations & Tolerance Framework — Create a formal register of entity-level critical operations and define tolerance levels (max disruption time, max data loss, and minimum service levels under alternative arrangements). Current BCP has RTO/RPO for building systems but no entity-wide tolerance framework; add linkage from building systems to financial operations where applicable. BCP_Melbourne_CBD...
116 (Risk mgmt framework incl. BCPs)	"... business continuity plan(s) (BCPs) that set out how the entity would identify, manage and respond to a disruption within tolerance levels and are regularly tested with severe but plausible scenarios; ..." APRA Prudential Stan...	Testing, Exercises & Maintenance — <i>Partially acceptable.</i> You have quarterly drills and an annual multi-scenario exercise. Update to explicitly test against defined tolerance levels across <i>all</i> critical operations (not only building systems). Document scenario catalogue and pass/fail criteria tied to tolerances. BCP_Melbourne_CBD...

Subcontractor Special Conditions

Clause ID & Title	Clause Text (verbatim)	Summary of Obligation on Subcontractors
1.1 – Definitions and interpretation — "Service Provider"	"**Service Provider ** The officers, employees, agents and subcontractors of the Service Provider." FDIA - WTP Australia ...	Subcontractors fall within "Service Provider," so any obligation imposed on the Service Provider applies to subcontractors.
4.3 – Personnel	"4.3 Personnel a) The Service Provider must ensure that all personnel utilised by it in connection with the Services are appropriately qualified, competent and experienced in the provision of services of the nature of the Services. b) The Service Provider must use only the persons named in the Service Provider's Proposal, or alternates agreed to in writing by the Principal (which agreement may be given or withheld in the Principal's absolute discretion), to provide the Services. c) The Service Provider's responsibility for the performance of the Services and for the standard of performance by its personnel is not altered in any way by this clause 4.3 or by anything done in accordance with this clause 4.3" FDIA - WTP Australia ...	Subcontractor staff must be suitably qualified/experienced; any alternates need Principal's written approval. KPMG remains responsible for subcontractor performance standards.

Best Practice Tips

Best Practice Tips

Scenario	Tip
Clearly structure your information in the prompt/agent instructions	Then response will be clearly structured: • Use headings, numbered steps, clearly labelled input files • This also makes it easy for explainability, reuse and adaptability
For negative instructions	“Avoid” or “Please do not ...”
For instructions that the AI model does not always adhere to, use capital letters and double asterixis to add extra emphasis	**YOU MUST** ACTION EVERY POINT ABOVE!
When language and style of content depends on the audience, use this sentence	“Use a tone suitable for ____.”
When response size is important, use this sentence	“Use at most [n words/paragraphs].”
Employ grammatically correct language and remove contradictory and/or unclear instructions	If the sentence is written poorly, then the AI can misinterpret the intent of the instructions, which leads to variations in prompt responses.
Employ clear and consistent formatting of information	Segment information within a prompt/agent instructions logically with headings, use double hashes as the prefix for headings, and use bullet points for lists of information.
Give the AI model time to think for complex prompts	End a complex prompt with: “Take a deep break and think about this problem step-by-step. This is very important to my career.”
When the AI model must perform interpretations	Always include a ‘## Guidance’ section and list the conditions or patterns of thinking you want it to follow.
